

METHOD AND APPARATUS FOR ENHANCING ONLINE SEARCHING

ABSTRACT OF THE DISCLOSURE

A method and apparatus are provided for processing search results obtained in response to a user query. This may include examining document pointers returned by a search engine to identify a source from which the 5 documents are available and generating at least two visual abstracts of each of the documents. Each of the visual abstracts may be of a different size. The method and system may also include formatting a stream of data such that when the data is displayed, a smaller one of the visual abstracts appears adjacent to a 10 corresponding search result.
